MediSense AI

Intelligent Medication Verification Assistant

TEAM MEMBERS:

Nithya Ramindla(Team Lead)

Bhukya Vaishali

The Problem

Medication Errors Are Preventable — Yet Widespread

What goes wrong today?

- **Wrong medicine intake:** Patients consume incorrect prescriptions due to look-alike packaging
- **Expired medicines:** No verification step before consumption — expiry dates go unchecked
- **Reminder apps fall short:** Current tools notify but never verify what is actually being taken

The Solution

Verify Before You Consume

MediSense AI is not a reminder app. It is a verification-based safety system that uses camera, AI vision, and OCR to confirm medicine identity and expiry before consumption

Every dose is confirmed safe before it reaches the patient , closing the gap between reminder and real-world intake

The WorkFlow

UI Screens & Technology Stack

Application Screens

Technology Stack

- **Frontend:** React.js + Tailwind CSS
- **Camera:** WebRTC for real-time capture
- **AI Vision:** Vision API (mock integration)
- **OCR:** Text extraction from medicine packaging

Innovation

Not a Reminder App — A Safety System

The MediSense Difference

Traditional apps send a notification and assume compliance. MediSense AI introduces a **verification gate**, the patient must scan the medicine before the system confirms it is safe to consume.

Traditional Apps

Notify → Assume → No verification

MediSense AI

Notify → Scan → Verify → Confirm

Conclusion

Safer Healthcare Starts with Verification

➤ Reduced Errors

AI-assisted verification closes the gap between reminder and real intake

➤ Patient Safety

Protects vulnerable populations — elderly, polypharmacy, and chronic patients

➤ Scalable Impact

Lightweight, integrable, and deployable across clinics, hospitals, and homes
